	HW 0908	HW 0924	HW 1020	HW 1029	HW 1124			So Far
Appreciate and express the art and science of interaction design, inclured in software design and development.	uding i	ts thec	ries, p	rincipl	es, me	thodo	logies,	and
Understand and express how interaction design relates to mental models.		+						+
Understand and describe core interaction design concepts: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings.		I						1
Understand and report on how humans behave and interact with the u	ıser int	erface	s of re	al-wor	ld syst	tems a	nd sof	tware.
Conduct and document a real-world study of how a cohort of users responds to a particular user interface, including but not limited to capturing and prioritizing usability metrics and correlating results to mental models and interaction design theories.		I						ı
Effectively use: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings to make appropriate, well-founded interaction design decisions.		ı						1
Demonstrate the fundamentals behind designing and implementing us	ser inte	erfaces						
Know and understand how user interfaces are constructed, especially the model-view-controller (MVC) paradigm.								
Know and understand event-driven programming.								
Follow academic and technical best practices throughout the course.								
Write syntactically correct, functional code.								
Demonstrate proper separation of concerns, especially MVC.								
Write code that is easily understood by programmers other than yourself.								
Use available resources and documentation to find required information.	+	+						+
	Appreciate and express the art and science of interaction design, inclinate in software design and development.  Understand and express how interaction design relates to mental models. Understand and describe core interaction design concepts: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings.  Understand and report on how humans behave and interact with the understand and report on how humans behave and interact with the understand document a real-world study of how a cohort of users responds to a particular user interface, including but not limited to capturing and prioritizing usability metrics and correlating results to mental models and interaction design theories.  Effectively use: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings to make appropriate, well-founded interaction design decisions.  Demonstrate the fundamentals behind designing and implementing use the model-view-controller (MVC) paradigm.  Know and understand how user interfaces are constructed, especially the model-view-controller (MVC) paradigm.  Know and understand event-driven programming.  Follow academic and technical best practices throughout the course.  Write syntactically correct, functional code.  Demonstrate proper separation of concerns, especially MVC.  Write code that is easily understood by programmers other than yourself.	Appreciate and express the art and science of interaction design, including is role in software design and development.  Understand and express how interaction design relates to mental models.  Understand and describe core interaction design concepts: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings.  Understand and report on how humans behave and interact with the user interaction and document a real-world study of how a cohort of users responds to a particular user interface, including but not limited to capturing and prioritizing usability metrics and correlating results to mental models and interaction design theories.  Effectively use: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings to make appropriate, well-founded interaction design decisions.  Demonstrate the fundamentals behind designing and implementing user interaction and understand how user interfaces are constructed, especially the model-view-controller (MVC) paradigm.  Know and understand event-driven programming.  Follow academic and technical best practices throughout the course.  Write syntactically correct, functional code.  Demonstrate proper separation of concerns, especially MVC.  Write code that is easily understood by programmers other than yourself.	Appreciate and express the art and science of interaction design, including its theories in software design and development.  Understand and express how interaction design relates to mental models.  Understand and describe core interaction design concepts: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings.  Understand and report on how humans behave and interact with the user interface.  Conduct and document a real-world study of how a cohort of users responds to a particular user interface, including but not limited to capturing and prioritizing usability metrics and correlating results to mental models and interaction design theories.  Effectively use: usability metrics; interaction design guidelines, principles, & theories; interaction styles; and affordances & natural mappings to make appropriate, well-founded interaction design decisions.
